# Impacted Cuspids

Impacted cuspids are a fairly common orthodontic problem. They are exposed and bone is removed to create a channel to allow the tooth to be moved into the arch using orthodontic forces. Sometimes the tooth has to be moved to the mesial or the distal to avoid the roots of the adjoining teeth. With modern surgical techniques and orthodontic treatment alignment is almost always successful.

**Before**

**After**

The upper right cuspid was impacted on the palate behind the lateral incisor. Note that the lateral incisor was displaced from this.

**Before**

**After**

*Happy New Year!*

We hope that you had a wonderful and restful holiday season.

We greatly appreciate the opportunity to be of service to you. It is always a pleasure to work with your office and provide the highest quality of care for your patients. We look forward to another great year of working with you and your staff.

Sincerely,

Dr. Mike Rogers,  
Dr. Lee Andrews & Team
